

Yogesh Dinesh Rane

Mumbai, MH | +91 8779269045 | yogeshrane019@gmail.com | github.com/yogu-code | linkedin.com/in/yogesh-rane

Objective

Backend-focused Software Developer experienced in Node.js, TypeScript, PostgreSQL, and Redis, with internship experience building real-time systems and broker API integrations. Seeking an SDE-1 or Junior Developer role in scalable backend systems.

Experience

Axiom Share Broking, Mumbai

Oct 2025 – Mar 2026

Software Engineer Intern

- Engineered QbarTrade, a unified trading platform integrating 3 broker accounts (AngelOne, Zerodha, Groww), enabling users to execute, plan, and track trades from a single application.
- Implemented OAuth login and REST API integrations for Zerodha Kite and Groww, supporting LTP fetching, order placement, and stop-loss management across all 3 brokers.
- Architected automatic order execution for Zerodha, eliminating manual trade steps by triggering orders directly from user-defined trade plans.
- Designed PostgreSQL database schemas and Python backend services to handle trade data, user sessions, and broker state management.
- Delivered a backtesting module enabling strategy validation against historical market data, reducing manual analysis effort for the trading team.

Nexcore Alliance, Mumbai

Apr 2025 – Oct 2025

Junior Software Developer Intern

- Designed and deployed an NLP chatbot for the AMD platform using the Gemini API, converting natural language queries into MongoDB queries to connect users with relevant industry experts.
- Implemented a WebSocket-based real-time chat system using Socket.IO, supporting live messaging and file sharing between users and experts.
- Architected backend logic for NEET720 exam platform, implementing question paper generation from a curated bank of 20,000+ questions and automated progress tracking for students and teachers.
- Developed the complete frontend for both AMD chat and NEET720 using Next.js, delivering student dashboards, test-taking interface, classroom management, and expert discovery flows.

Projects

IronQueue – Distributed Job Queue System (BullMQ-Inspired)

Node.js, TypeScript, Redis, ioredis | GitHub

- Built a Redis-backed job queue from scratch with atomic job claiming via Lua scripts, a Worker class architecture, and a pluggable job handler registry.
- Designed lock-token fencing to prevent race conditions between stalled-job recovery and active workers, eliminating duplicate job execution caused by false-positive stall detection.
- Diagnosed a concurrency bug via load testing where requeued "stalled" jobs ran concurrently with their still-active originals, causing duplicate side effects and SMTP rate-limit cascades; fixed via token-based fencing and stall-threshold tuning, restoring throughput from 0.58 to 1.84 jobs/sec.
- Implemented exponential backoff retry logic with configurable max attempts and built a custom load-testing script to benchmark throughput, completion rate, and failure recovery under concurrent load.

Webhook Delivery Service

Node.js, TypeScript, PostgreSQL, Prisma, BullMQ, Docker | GitHub

- Architected a production-grade webhook delivery service using BullMQ and Node.js, guaranteeing at-least-once delivery with exponential backoff retry logic and delivery status tracking via PostgreSQL and Prisma ORM.
- Containerized the full stack using Docker and Docker Compose, managing environment variables and volume configuration for consistent local and production parity.

Education

Mumbai University

Jun 2023 – Jun 2026

Bachelor of Science in Computer Science | CGPA: 7.7/10

Technical Skills

Languages: Python, TypeScript, JavaScript

Backend: Node.js, Express.js, Django, Django REST Framework, BullMQ

Databases: PostgreSQL, MongoDB, Redis

ORM / Query: Prisma, Mongoose

Frontend: React.js, Next.js, Tailwind CSS

Real-Time: Socket.IO, WebSocket

DevOps: Docker, Docker Compose

APIs & Integrations: RESTful APIs, Broker APIs (Zerodha Kite, Groww, AngelOne)
